

Dental Office Mixing Instructions

Dental Pulp Revitalization Triple Antibiotic Paste

Under Prescription

This is a 2-part system consisting of:

Syringe #1 = Dry powder with the following ingredients:

- a) Metronidazole USP – 43%
- b) Ciprofloxacin HCl USP – 14%
- c) Clindamycin HCl USP – 43%

Syringe #2 = Biodegradable liquid vehicle base:

- a) Polyethylene Glycol 300 MW liquid – 50%
- b) Propylene Glycol – 50%

Also supplied are a syringe to syringe adapter (red) for mixing the 2 syringes and a Flowthru Standard Style 20 gauge tip for administration. The syringes are provided in an amber bag to protect the powders from degradation due to light. The product does not require refrigeration.

Mixing instructions

1. Remove the black cap from each syringe.
2. Twist the syringe to syringe adapter (red) onto the end of each syringe to connect the 2 syringes together.
3. Inject the contents of the liquid component into the powder syringe, and mix the syringes back and forth 30-40 times.
4. Leave the syringes connected and allow the product time to stiffen.
5. ***The material will be too thin to use for approximately 20 minutes.
6. Remix the syringes approximately 10 times.
7. Push all of the contents into 1 of the syringes, and then unscrew the syringe from the adapter.
8. Attach the Flowthru Standard Style 20 gauge tip and place the material into the tooth.

Beyond-Use-Dating (BUD)

The product is being provided in a 2 part system to extend the shelf life of the product. Before the product is mixed, we have determined that the BUD is 180 days from the date we mixed the powders in our lab and placed them into the syringes. Once the product is mixed, the paste is stable for up to 90 days if stored in the refrigerator, protected from light.
